Historical Perspective of Biotherapy

Origins and Early Developments

The roots of biotherapy trace back over a century, with pioneering experiments and observations laying the groundwork for modern practice:

- **Late 19th Century:** The concept of stimulating the immune system to combat disease gained traction. William B. Coley, often called the "Father of Immunotherapy," in the 1890s, injected bacterial toxins (Coley's toxins) into cancer patients, observing tumor regressions. Although

controversial, it was among the first documented attempts at biological cancer therapy.

- 1930s-1950s: Advances in bacteriology and microbiology led to the development of vaccines and sera. The use of antitoxins and antivenoms became routine, harnessing specific antibodies for therapeutic purposes.

- Mid-20th Century: The discovery of antibiotics shifted focus temporarily, but the understanding of the immune system expanded, setting the stage for more targeted biotherapies.

Evolution into Modern Biotherapy

- Immunology Breakthroughs: The discovery of lymphocytes, antibodies, cytokines, and cell-mediated immunity during the 1950s-1970s enabled targeted approaches.

- Development of Monoclonal Antibodies (mAbs): In the 1970s, Köhler and Milstein developed hybridoma technology, allowing production of specific monoclonal antibodies, revolutionizing biotherapy.
