Matlab code for license number plate extraction

matlab code for license number plate extraction is a crucial component in various automated vehicle identification systems, such as toll collection, parking management, traffic monitoring, and law enforcement. Developing an efficient and reliable MATLAB code for license plate extraction involves a combination of image processing techniques, computer vision algorithms, and sometimes machine learning methods. This article provides a comprehensive guide to creating robust MATLAB code for license plate extraction, including preprocessing steps, segmentation, character recognition, and optimization tips.

Understanding the Importance of License Plate Extraction in MATLAB

License plate extraction is a subset of the broader field of Automatic Number Plate Recognition (ANPR). It enables systems to automatically detect and read vehicle registration numbers from images or videos. MATLAB, with its extensive image processing toolbox, simplifies the development of such systems, offering a wide range of functions for filtering, edge detection, morphological operations, and pattern recognition.

Basic Workflow for License Plate Extraction in MATLAB

The process generally follows these steps:

- **Image Acquisition:** Obtain a clear image or frame from a video feed.
- **Preprocessing:** Improve image quality for better detection.
- **License Plate Localization:** Detect and locate the license plate region.
- **Segmentation:** Isolate individual characters on the plate.
- **Character Recognition:** Identify characters using OCR techniques.

This pipeline can be customized and optimized depending on the application environment, image quality, and vehicle types.

Developing MATLAB Code for License Plate Extraction

1. Image Acquisition and Preprocessing

The first step involves importing the image into MATLAB and preparing it for processing.

```
```matlab

% Read the vehicle image

img = imread('vehicle_image.jpg');

% Convert to grayscale for simpler processing

grayImg = rgb2gray(img);

% Enhance contrast (optional, depending on image quality)

enhancedImg = imadjust(grayImg);

% Display the original and preprocessed images

figure;

subplot(1,2,1); imshow(grayImg); title('Grayscale Image');

subplot(1,2,2); imshow(enhancedImg); title('Enhanced Image');

```
```

Preprocessing techniques such as noise reduction (median filtering), contrast adjustment, and edge enhancement improve detection accuracy.

```
```matlab

% Reduce noise with median filtering

denoisedImg = medfilt2(enhancedImg, [3 3]);

```
```

2. License Plate Localization

Locating the license plate involves detecting regions with specific characteristics?high contrast, rectangular shape, and text-like features.

Approach:

- Use edge detection (e.g., Sobel, Canny)
- Find contours or connected components
- Filter regions based on aspect ratio, area, and rectangularity

```
```matlab
```

```
% Edge detection
```

```
edges = edge(denoisedImg, 'Canny');
```

```
% Dilate edges to close gaps
```

```
se = strel('rectangle', [3,3]);
```

```
dilatedEdges = imdilate(edges, se);
```

```
% Find connected components
```

```
cc = bwconncomp(dilatedEdges);
```

```
stats = regionprops(cc, 'BoundingBox', 'Area', 'EulerNumber');
```

```
% Filter based on area and shape
```

```
minArea = 1000;
```

```
maxArea = 30000;
```

```
candidateRegions = [];
```

```
for k = 1:length(stats)
```

```
 bbox = stats(k).BoundingBox;
```

```
aspectRatio = bbox(3) / bbox(4);

if stats(k).Area > minArea && stats(k).Area < 2 && aspectRatio
candidateRegions = [candidateRegions; bbox];

end

end

% Visualize candidate regions

figure; imshow(img); hold on;

for i = 1:size(candidateRegions,1)

rectangle('Position', candidateRegions(i,:), 'EdgeColor', 'g', 'LineWidth', 2);

end

title('Detected License Plate Regions');

hold off;

...

```

Note: Further refinement may include applying morphological operations to improve detection robustness.

### 3. Cropping and Extracting the License Plate Region

Once the candidate regions are identified, crop the region for detailed analysis.

```
```matlab

% Assume the first candidate is the license plate

plateBox = candidateRegions(1, :);

plateImage = imcrop(grayImg, plateBox);

% Display the cropped license plate

```

```
figure; imshow(plateImage); title('Cropped License Plate');
```

```
```
```

## 4. License Plate Character Segmentation

With the license plate isolated, segment individual characters to prepare for OCR.

Steps:

- Binarize the plate image
- Remove noise
- Segment characters based on vertical projection

```
```matlab
```

```
% Binarize the image
```

```
binaryPlate = imbinarize(plateImage, 'adaptive', 'ForegroundPolarity', 'dark', 'Sensitivity', 0.4);
```

```
% Invert if necessary
```

```
if mean(binaryPlate(:)) > 0.5
```

```
binaryPlate = ~binaryPlate;
```

```
end
```

```
% Remove small objects
```

```
cleanPlate = bwareaopen(binaryPlate, 50);
```

```
% Label connected components
```

```
ccChars = bwconncomp(cleanPlate);
```

```
statsChars = regionprops(ccChars, 'BoundingBox');
```

```
% Visualize segmented characters
```

```
figure; imshow(plateImage); hold on;

for i = 1:length(statsChars)

rectangle('Position', statsChars(i).BoundingBox, 'EdgeColor', 'r', 'LineWidth', 2);

end

title('Segmented Characters');

hold off;

```
```

Note: Proper segmentation is critical for accurate OCR results.

## 5. Optical Character Recognition (OCR)

MATLAB provides the `ocr` function for recognizing characters within images.

```
```matlab

recognizedText = "";

for i = 1:length(statsChars)

charBox = statsChars(i).BoundingBox;

charImage = imcrop(cleanPlate, charBox);

% Resize to improve OCR accuracy

resizedChar = imresize(charImage, [50 50]);

% Recognize character

ocrResults = ocr(resizedChar, 'CharacterSet',
'0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZ');

recognizedText = [recognizedText, ocrResults.Text];

```
```

end

```
disp(['Detected License Plate Number: ', strtrim(recognizedText)]);
```

```
...
```

Tips for improving OCR accuracy:

- Preprocess characters (resize, binarize)

```
se = strel('rectangle', [5, 15]);
```

```
dilatedEdges = imdilate(edges, se);
```

```
filledRegions = imfill(dilatedEdges, 'holes');
```

```
```
```

### 2.3. Region Properties and Filtering

Connected component analysis detects candidate regions:

```
```matlab

```

```
% Filter by size and aspect ratio
```

```
candidateRegions = [];
```

```
for k = 1:length(props)
```

```
    bbox = props(k).BoundingBox;
```

```
    aspectRatio = bbox(3)/bbox(4);
```

```
    if props(k).Area > 500 && aspectRatio > 2 && aspectRatio
```

```
        candidateRegions = [candidateRegions; bbox];
```

```
    end
```

```
end
```

```
```
```

### 2.4. Selecting the Best Candidate

Choosing the region most likely to be a license plate based on shape criteria:

```
```matlab
```

```
% For example, select the region with the largest area
```

```
[~, idx] = max([props.Area]);
```

```
licensePlateRegion = props(idx).BoundingBox;
```

```
...
```

- Character Segmentation

Once the license plate region is identified, further segmentation isolates individual characters:

```
```matlab
```

```
x = round(licensePlateRegion(1));
```

```
y = round(licensePlateRegion(2));
```

```
width = round(licensePlateRegion(3));
```

```
height = round(licensePlateRegion(4));
```

```
plateImg = imcrop(enhancedImg, [x y width height]);
```

```
...
```

#### 3.2. Binarization

Applying adaptive thresholding to account for lighting variations:

```
```matlab
```

```
bwPlate = imbinarize(plateImg, 'adaptive', 'ForegroundPolarity', 'dark', 'Sensitivity', 0.4);
```

```
...
```

3.3. Character Isolation

Using morphological operations to separate characters:

```
```matlab
```

```
seChar = strel('rectangle', [3, 3]);

cleanPlate = imopen(bwPlate, seChar);

charProps = regionprops(cleanPlate, 'BoundingBox', 'Area');

% Filter out small regions

characters = [];

for k = 1:length(charProps)

 if charProps(k).Area > 100

 characters = [characters; charProps(k).BoundingBox];

 end

end

...

```

### 3.4. Sorting Characters

Order characters from left to right based on bounding box x-coordinate:

```
```matlab

[~, order] = sortrows(characters, 1);

sortedCharacters = characters(order, :);

...

```

- Optical Character Recognition (OCR)

Matlab provides built-in OCR functionality that can be integrated seamlessly:

```
```matlab

```

```
recognizedText = "";

for k = 1:size(sortedCharacters, 1)

 charBox = sortedCharacters(k, :);

 charROI = imcrop(cleanPlate, charBox);

 ocrResult = ocr(charROI, 'CharacterSet', 'ABCDEFGHIJKLMNOPQRSTUVWXYZ0123456789',
 'TextLayout', 'Block');

 recognizedText = [recognizedText, ocrResult.Text];

end

...
```

Cleaning the recognized text to remove artifacts or errors:

```
```matlab

licenseNumber = strtrim(recognizedText);

licenseNumber = regexprep(licenseNumber, '^[A-Z0-9]', "");

...
```

Challenges and Improvements in Missouri's Temporary License Plate System

Despite the structured approach, Missouri's temporary license plate system faces challenges that impact efficiency, security, and user experience.

Common Challenges

- Counterfeit Plates: Sophisticated forgery can undermine the system's integrity
- Limited Duration: Short validity periods can inconvenience vehicle owners
- Administrative Delays: Processing times may vary, leading to expired plates
- Dealer Fraud: Some dealerships attempt to issue multiple or unauthorized temporary plates

Potential Improvements

- Transitioning to digital temporary plates with QR codes or RFID chips for enhanced security
- Extending validity periods for certain cases to accommodate delays
- Implementing online applications and real-time tracking for quicker issuance
- Increased dealer oversight and auditing to prevent abuse
