- Calculating Dose Based on Weight

Example Problem:

A patient requires 5 mg/kg of a medication. The patient weighs 70 kg. The medication available has a concentration of 50 mg/mL. How many milliliters should be administered?

Solution Steps:

- Calculate total dose: $5 \text{ mg/kg} \times 70 \text{ kg} = 350 \text{ mg}$
- Determine volume to administer: $350 \text{ mg} \div 50 \text{ mg/mL} = 7 \text{ mL}$

Final Answer:

Administer 7 mL of the medication.

- Converting Between Units

Example Problem:

A medication dose is prescribed as 0.5 g. The medication stock solution is 250 mg/mL. How many milliliters are needed?

Solution Steps:

- Convert grams to milligrams: $0.5 \text{ g} \times 1000 \text{ mg/g} = 500 \text{ mg}$
- Calculate volume: $500 \text{ mg} \div 250 \text{ mg/mL} = 2 \text{ mL}$

Final Answer:

Administer 2 mL of the solution.

- Calculating Infusion Rates

Example Problem:

You need to administer 1000 mL of IV fluid over 8 hours. The infusion set delivers 15 drops/mL. What is the flow rate in drops per minute?

Solution Steps:

- Convert hours to minutes: $8 \text{ hours} \times 60 \text{ minutes} = 480 \text{ minutes}$
- Calculate drops per minute: $(1000 \text{ mL} \times 15 \text{ drops/mL}) \div 480 \text{ minutes} = 31.25 \text{ drops/min}$

Question What is the formula for calculating drug dosage based on patient weight? The common formula is: $\text{Dose (mg)} = (\text{Desired dose per kg}) \times (\text{Patient's weight in kg})$. How do you determine the correct volume of medication to administer when given a concentration? Use the formula: $\text{Volume (mL)} = \text{Dose (mg)} / \text{Concentration (mg/mL)}$. A patient needs 250 mg of medication. The medication available is 50 mg/mL. How many mL should be administered? $\text{Volume to administer} = 250 \text{ mg} / 50 \text{ mg/mL} = 5 \text{ mL}$. If a medication order is for 0.5 mg and the drug concentration is 2 mg/mL, what is the volume to give? $\text{Volume to give} = 0.5 \text{ mg} / 2 \text{ mg/mL} = 0.25 \text{ mL}$. How do you convert a dosage prescribed in mg to an international unit (IU)? Conversion depends on the medication; for example, 1 mg of insulin equals 100 IU. Always refer to the specific conversion factor for each drug. What is the importance of verifying calculations in dosage problems? Verifying calculations ensures patient safety by preventing medication errors, overdose, or underdose. How can dimensional analysis aid in solving dosage calculation problems? Dimensional analysis helps systematically convert units and ensure accurate calculations by setting up conversion factors appropriately. What are common mistakes to avoid when practicing dosage

calculation problems? Common mistakes include incorrect unit conversions, misreading orders, forgetting to double-check calculations, and not verifying the final dose against the order.
